

Scenarios : Real Estate Agency Management System

Era - Real Estate Agent

Era receives a lot of new leads through the agency website and word-of-mouth referrals, but when she is out showing properties, those leads often call a competitor before she has a chance to respond. She needs to be notified the moment a new lead comes in so she can reply immediately, even while on the move.

When she speaks to a client, she scribbles notes in a paper notebook or saves voice notes on WhatsApp. Later, she struggles to remember exact details , budget, preferred neighborhood, number of bedrooms. She wants to log these preferences directly into the system during or right after the call so that the next time she speaks to that client, everything is already there without digging through old chats.

Era manages property viewings manually, often texting sellers and buyers separately. Double bookings happen more often than she would like, especially during the busy summer season. She wants to schedule viewings inside a shared system so that conflicts are flagged automatically and both buyers and sellers receive confirmation and reminders without her having to message everyone individually.

When a client makes an offer, Era currently tracks the negotiation over WhatsApp. She has lost track of counter offers before, which has caused embarrassing moments with clients. She needs a place to log every offer and see the full negotiation trail clearly, so she always knows exactly where a deal stands.

At the end of a successful deal, Era has to manually calculate her commission and then check with the office to make sure the paperwork matches the number. She wants the system to calculate this for her automatically the moment a deal is closed.

Artan - Senior Real Estate Agent & Appraiser

Artan's biggest problem is long-term clients. He has conversations with potential sellers who are not ready to list for another six months, but by the time he remembers to follow up, they have already signed with another agency. He needs the system to remind him when it is time to reach out to a client again, with enough context from their last conversation so he can pick up where he left off.

He also manages several high-value properties that have been sitting on the market for months. He is not always aware of how long until an owner calls to complain. He needs the system to alert him when a property he is responsible for has not had any viewings or activity for more than a set number of days, so he can proactively recommend price adjustments before the relationship with the owner becomes strained.

Artan maintains detailed valuation reports with photos, site notes, and comparable sales data stored across various folders and notebooks. He wants a way to attach all of this directly to the property record in the system so that he or anyone else in the agency can retrieve it instantly without digging through old files.

Miranda - Office Manager & Client Relations Lead

Miranda spends too much time acting as a human scheduler, juggling calls from clients who were promised viewing times that no agent remembered to book. She needs a shared client calendar that agents actually use, one that shows availability, confirms viewings, and sends automatic reminders to both agents and clients so she can stop being the go-between.

When a walk-in client arrives at the agency, Miranda currently has to assess who is available, call around to agents, and hope someone is free. Sometimes clients are left waiting. She wants the system to automatically log walk-in client inquiries and assign them to agents based on availability and specialization so that no client leaves without being helped.

Miranda prepares all the paperwork for signatures, printing contracts, scanning them, and filing physical copies. She often watches agents scramble to find a contract she prepared days earlier, or hears from a client who was promised a signed copy that never arrived. She wants a system that digitizes document storage so she can upload contracts once, and agents can access them from their phones during meetings. She also wants to track when documents are viewed and signed.

Elton - Property Seller

Elton has had his property listed with the agency for four months and is growing impatient. He feels like he is constantly chasing his agent for updates, and he is not sure why two offers fell through. He needs to receive a simple, regular update perhaps a weekly summary — that tells him how many viewings his property had, what feedback was given, and whether the asking price is still realistic.

Elton wants to know the moment an offer is submitted, so he is not left waiting for days without knowing what is happening. He does not want to log into any software himself, but he needs to feel informed through automatic notifications sent to his phone.

He also wants the system to flag when his property has received no viewings for a set period, so that the agency can proactively reach out to him with recommendations rather than waiting for him to complain.
