

1. User Scenarios

Scenario 1: Onboarding a New Lead

Elira receives a DM on Instagram from a potential client interested in buying a 2-bedroom apartment in Tirana with a budget of €80,000. She copies the client's message and pastes it into the REMS new client intake screen. The system parses the message and automatically extracts the client's budget, preferred property type, and location, highlighting any fields it is uncertain about so she can correct them. She reviews the extracted data, fills in the client's name and WhatsApp number, and confirms the lead source as Instagram. She tags the client as Active and approves the system's suggested 7-day follow-up reminder. The client's profile is saved and appears immediately on her active client dashboard with a follow-up countdown. The entire process takes under two minutes from receiving the DM to having a complete, structured client record in the system.

Scenario 2: Property Status Update in the Field

Elira is at a property with a client who decides she is not interested. From her phone, she opens the viewing record, taps Log Feedback, selects Not Interested, and adds a short note: 'Ceiling too low.' The system marks the property as Shown for this client and immediately suggests alternative listings that match the client's saved preferences, automatically excluding properties already shown. Elira reviews the two top suggestions and taps Draft Message, which generates a WhatsApp message presenting both alternatives. She edits one line and sends it directly from within REMS. The interaction is logged automatically, the client's next follow-up reminder is recalculated, and the property's status remains Available, unaffected by the viewing outcome. All of this happens while she is still standing in the property.

Scenario 3: Scheduling and Managing a Viewing

A client confirms she wants to view a property on Thursday morning. Elira opens the Schedule Viewing screen, where REMS has already read her Google Calendar and is presenting three available time slots for Thursday. She selects 11:00 AM, confirms the client and property, and saves the appointment. The viewing syncs to her Google Calendar automatically and the system generates a confirmation message draft addressed to the client. Elira reviews it, makes a small edit, and sends it via WhatsApp from the same screen. On Thursday at 9:00 AM she receives a push reminder. At 9:00 AM the morning of the viewing she receives a reminder with the client's name, the property address, and a link to the listing. After the viewing, REMS prompts her to log feedback. She records the client's reaction as Very Interested and adds a note: 'Wants to make an offer.' The system immediately suggests her next action: Create Deal. She taps the suggestion and proceeds directly to the deal pipeline.

Scenario 4: Managing a Deal Through Negotiation

Following the viewing, Elira creates a deal in REMS linking the client, the property, and the owner. The system sets the initial stage to Offer Initiated and automatically calculates the expected commission at 2%, since Elira brought both the client and the property. She logs the client's offered price and contacts the owner by phone. She returns to the deal record and logs the owner's counter-offer, advancing the stage to Negotiation in Progress. Over the following days she moves the deal through Verbal Agreement and Security Deposit Paid, uploading the deposit contract at each stage when prompted by the system. When the legal representative is

ready, she adds them as a party to the deal and moves the stage to Legal Review. Three days later she receives a stall alert , no update has been logged in 72 hours , which prompts her to follow up with the lawyer. Once the final contracts are signed, she advances the deal to Final Sale Signed and uploads the executed contract. The deal is automatically closed, the property status updates to Sold, and the commission is marked as Pending in her financial summary.

Scenario 5: Long-term Client Follow-up

A client Elira met four months ago was not ready to buy at the time but asked to be kept in mind. Elira had set a 90-day check-in reminder on the client's profile. Tonight, REMS runs its nightly matching process and finds that a newly added listing matches the client's saved preferences for a 2-bedroom apartment in Tirana under €85,000. The following morning Elira receives a push notification: a match has been found for this client. She taps through to the profile, reviews the brief interaction summary showing the last conversation from four months ago, and reads the AI-generated WhatsApp draft that mentions the new listing by name and references the client's original preferences. She edits two words and sends the message. The interaction is logged automatically and a new 45-day reminder is set. The client replies the same day asking for a viewing.

Scenario 6: Reviewing Monthly Finances

At the end of the month, Elira opens the Financial Summary screen and selects the current month filter. REMS displays three closed deals with a total expected commission of €4,200. One commission of €1,400 is still marked Pending. The system has flagged it with a suggested follow-up action, so she taps the suggestion, reviews the auto-drafted payment reminder, and sends it to the relevant party. She then logs €350 in expenses across the three deals: photography for one listing, fuel across two viewings, and a broker fee. The net earnings figure updates immediately to €2,450 received with €1,400 still outstanding. She checks her progress against her €3,000 monthly target and sees she is 18% short. The system highlights two stalled deals and three overdue follow-ups as the areas most likely to move the needle. She notes these and plans her priorities for the following week.

Scenario 7: Handling a Collapsed Deal

A deal in the Legal Review stage collapses because the client's bank loan application has been rejected. Elira opens the deal record in REMS and flags it as At Risk, adding the reason: 'Loan rejected by bank.' After confirming the deal cannot proceed, she marks it as Closed - Lost. The system immediately resets the property status to Available and removes the pending commission entry from her financial summary. It then presents three suggested recovery actions: explore re-financing options with the client, suggest a lower-budget property, or pause the search and re-engage in 60 days. She selects the second option. REMS runs a new match query with a reduced budget filter and surfaces two alternative properties. It also generates a draft WhatsApp message for the client acknowledging the situation and presenting the alternatives. Elira edits the tone slightly and sends the message. The interaction is logged, a 14-day follow-up reminder is set, and the re-available property is already showing up in match results for two other clients on her list.
