

User Scenarios

Scenario 1: Onboarding a New Lead

Scenario: Elira receives a DM on Instagram from a potential client interested in buying a 2-bedroom apartment in Tirana with a budget of €80,000 and wants to create a structured client record in REMS.

Main Sequence:

1. Elira copies the client's Instagram DM and pastes it into the REMS new client intake screen.
2. The system parses the message and automatically extracts the client's budget, preferred property type, and location.
3. The system highlights any fields it is uncertain about for Elira to review and correct.
4. Elira reviews the extracted data and fills in the client's name and WhatsApp number.
5. Elira confirms the lead source as Instagram.
6. Elira tags the client as Active.
7. Elira approves the system's suggested 7-day follow-up reminder.
8. The system saves the client's profile.
9. The client appears immediately on the active client dashboard with a follow-up countdown.

Alternative Sequence:

- If the system is uncertain about any extracted field, it highlights those fields and requires Elira's manual confirmation before saving.
- If Elira leaves any required field blank (e.g., client name), the system prompts her to complete it before proceeding.

Special Requirements:

- Natural language processing capability to parse unstructured messages.
- Automatic follow-up reminder calculation based on lead source and client status.
- Real-time dashboard update after record creation.

Post-condition: A complete, structured client record is saved in REMS with extracted preferences, active status, and scheduled follow-up reminder. The entire process takes under two minutes.

Scenario 2: Property Status Update in the Field

Scenario: Elira is at a property with a client who decides she is not interested, and needs to log feedback and find alternative listings immediately from her phone.

Main Sequence:

1. Elira opens the viewing record from her phone while still at the property.
2. Elira taps Log Feedback.
3. Elira selects Not Interested from the feedback options.
4. Elira adds a short note: "Ceiling too low."
5. The system marks the property as Shown for this client.
6. The system immediately queries and suggests alternative listings that match the client's saved preferences.
7. The system automatically excludes properties already shown to this client.
8. Elira reviews the two top suggestions.
9. Elira taps Draft Message.
10. The system generates a WhatsApp message presenting both alternative listings.
11. Elira edits one line of the message.
12. Elira sends the message directly from within REMS.

Alternative Sequence:

- If no alternative listings match the client's preferences, the system notifies Elira and suggests broadening the search criteria.
- If the generated WhatsApp message is not edited, Elira can still send it as drafted.

Special Requirements:

- Mobile-first interface designed for one-handed operation in the field.
- Real-time matching query excluding already-shown properties.
- WhatsApp deep-link integration for direct messaging from within REMS.
- Automatic interaction logging without manual entry.

Post-condition: The interaction is logged automatically, the client's next follow-up reminder is recalculated, the property's status remains Available unaffected by the viewing outcome, and alternative property suggestions have been sent to the client.

Scenario 3: Scheduling and Managing a Viewing

Scenario: A client confirms she wants to view a property on Thursday morning, and Elira needs to schedule the appointment, sync to her calendar, and confirm with the client.

Main Sequence:

1. Elira opens the Schedule Viewing screen in REMS.
2. The system reads Elira's Google Calendar and presents three available time slots for Thursday.
3. Elira selects 11:00 AM as the viewing time.
4. Elira confirms the client and property for the appointment.
5. Elira saves the appointment.
6. The system automatically syncs the viewing to Elira's Google Calendar.
7. The system generates a confirmation message draft addressed to the client.
8. Elira reviews the message draft.
9. Elira makes a small edit to the message.
10. Elira sends the message via WhatsApp from the same screen.
11. On Thursday at 9:00 AM (two hours before the viewing), Elira receives a push reminder with the client's name, property address, and link to the listing.
12. After the viewing, REMS prompts Elira to log feedback.
13. Elira records the client's reaction as Very Interested.
14. Elira adds a note: "Wants to make an offer."
15. The system immediately suggests the next action: Create Deal.
16. Elira taps the suggestion and proceeds directly to the deal pipeline.

Alternative Sequence:

- If a selected time slot becomes unavailable before saving, the system refreshes available slots and prompts Elira to reselect.
- If the calendar sync fails, the system queues the appointment for sync when connectivity is restored.
- If Elira does not log feedback immediately after the viewing, the system continues to prompt at each login until feedback is recorded.

Special Requirements:

- Two-way integration with Google Calendar API v3.
- Automated push notification scheduling (24 hours and 2 hours before viewing).
- Post-viewing feedback capture with next-action suggestion engine.
- WhatsApp message generation from within scheduling screen.

Post-condition: The viewing appointment is scheduled, synced to external calendar, confirmed to the client via WhatsApp, a reminder is set, and post-viewing feedback leads directly to deal creation.

Scenario 4: Managing a Deal Through Negotiation

Scenario: Following a successful viewing, Elira creates a deal and manages it through the full negotiation pipeline from offer initiation to final contract signing.

Main Sequence:

1. Elira creates a deal in REMS linking the client, the property, and the owner.
2. The system sets the initial stage to Offer Initiated.
3. The system automatically calculates the expected commission at 2% (Elira brought both client and property).
4. Elira logs the client's offered price.
5. Elira contacts the owner by phone.
6. Elira returns to the deal record and logs the owner's counter-offer.
7. Elira advances the deal stage to Negotiation in Progress.
8. Over the following days, Elira moves the deal through Verbal Agreement stage.
9. Elira moves the deal to Security Deposit Paid stage.
10. The system prompts Elira to upload the deposit contract at each stage.
11. Elira uploads the deposit contract when prompted.
12. Elira adds the legal representative as a party to the deal.
13. Elira advances the stage to Legal Review.
14. Three days later, the system sends a stall alert (no update logged in 72 hours).
15. Elira follows up with the lawyer based on the alert.
16. Once final contracts are signed, Elira advances the deal to Final Sale Signed.
17. Elira uploads the executed contract.
18. The system automatically closes the deal.
19. The system updates the property status to Sold.
20. The system marks the commission as Pending in Elira's financial summary.

Alternative Sequence:

- If Elira attempts to skip a required stage (e.g., moving from Negotiation directly to Legal Review without Verbal Agreement), the system prevents the transition and displays the required intermediate stages.
- If the deal collapses, Elira can mark it as Closed - Lost, and the system resets the property status to Available (see Scenario 7).
- If a party cannot be added because contact details are incomplete, the system prompts for missing information.

Special Requirements:

- Sequential stage enforcement with valid transition rules per stage.
- Automatic commission calculation based on deal sourcing structure.
- Per-stage document attachment prompts.
- Stalled deal notification after configurable period of inactivity (default 7 days).

- Automatic property status update on deal closure.

Post-condition: The deal progresses through all pipeline stages to closure, property status updates to Sold, commission is tracked as pending in financial summary, and all stage transitions and documents are logged.

Scenario 5: Long-term Client Follow-up

Scenario: A client from four months ago who was not ready to buy but asked to be kept in mind becomes active again when a matching property is listed.

Main Sequence:

1. Elira had previously set a 90-day check-in reminder on the client's profile.
2. Tonight, REMS runs its nightly matching process.
3. The system finds that a newly added listing matches the client's saved preferences (2-bedroom apartment in Tirana under €85,000).
4. The following morning, Elira receives a push notification: "A match has been found for [client name]."
5. Elira taps through to the client's profile.
6. Elira reviews the brief interaction summary showing the last conversation from four months ago.
7. Elira reads the AI-generated WhatsApp draft that mentions the new listing by name and references the client's original preferences.
8. Elira edits two words in the draft message.
9. Elira sends the message via WhatsApp from within REMS.
10. The system automatically logs the interaction.
11. The system automatically sets a new 45-day reminder on the client's profile.
12. The client replies the same day asking for a viewing.

Alternative Sequence:

- If no matching property is found during the nightly run, no notification is sent, and the existing check-in reminder remains active.
- If Elira does not respond to the match notification within 24 hours, the system sends a follow-up reminder.
- If the AI-generated draft is not edited, Elira can still send it as generated.

Special Requirements:

- Nightly batch process for client-property matching against new listings.
- AI-generated message drafts referencing historical context.
- Automatic reminder recalculation after each interaction.
- Push notification delivery within 60 seconds of matching process completion.

Post-condition: The client is re-engaged with a property match, an interaction is logged, a new follow-up reminder is set, and a viewing is requested.

Scenario 6: Reviewing Monthly Finances

Scenario: At the end of the month, Elira reviews her financial performance, checks progress against targets, and identifies actions to close income gaps.

Main Sequence:

1. Elira opens the Financial Summary screen in REMS.
2. Elira selects the current month filter.
3. The system displays three closed deals with a total expected commission of €4,200.
4. The system shows one commission of €1,400 still marked Pending.
5. The system flags the pending commission with a suggested follow-up action.
6. Elira taps the suggested action.
7. Elira reviews the auto-drafted payment reminder.
8. Elira sends the reminder to the relevant party.
9. Elira logs €350 in expenses across the three deals (photography for one listing, fuel across two viewings, one broker fee).
10. The system updates the net earnings figure immediately to €2,450 received with €1,400 still outstanding.
11. Elira checks her progress against her €3,000 monthly target.
12. The system displays she is 18% short of her target.
13. The system highlights two stalled deals and three overdue follow-ups as the areas most likely to move the needle toward her target.
14. Elira notes these items and plans her priorities for the following week.

Alternative Sequence:

- If no deals are closed in the selected period, the system displays zero commission and offers suggestions for lead generation activities.
- If Elira exceeds her target, the system displays a congratulatory message and suggests setting a higher target for next month.
- If expenses are logged after the net earnings view is open, the system refreshes the display automatically.

Special Requirements:

- Real-time financial calculation across expected, received, pending, and net earnings.
- Configurable monthly and quarterly sales targets with progress bars.
- Automated prioritisation engine linking financial gaps to specific pipeline actions.
- Exportable performance reports (PDF or spreadsheet) per FR_39.

Post-condition: Elira has a complete view of monthly financial performance, knows her gap to target, has logged all expenses, has taken action on pending commission, and has prioritised next week's activities based on system recommendations.

Scenario 7: Handling a Collapsed Deal

Scenario: A deal in the Legal Review stage collapses because the client's bank loan application is rejected, requiring Elira to close the deal, reset the property, and re-engage the client.

Main Sequence:

1. Elira opens the deal record in REMS.
2. Elira flags the deal as At Risk.
3. Elira adds the reason for risk: "Loan rejected by bank" (selected from predefined list or entered as free text).
4. After confirming the deal cannot proceed, Elira marks it as Closed - Lost.
5. The system immediately resets the property status to Available.
6. The system removes the pending commission entry from Elira's financial summary.
7. The system presents three suggested recovery actions: Explore re-financing options with the client; Suggest a lower-budget property; Pause the search and re-engage in 60 days.
8. Elira selects the second option: "Suggest a lower-budget property."
9. REMS runs a new match query with a reduced budget filter.
10. The system surfaces two alternative properties matching the reduced budget.
11. The system generates a draft WhatsApp message for the client acknowledging the situation and presenting the alternatives.
12. Elira edits the tone slightly.
13. Elira sends the message from within REMS.
14. The system automatically logs the interaction.
15. The system sets a 14-day follow-up reminder on the client's profile.
16. The re-available property automatically appears in match results for two other clients on Elira's list.

Alternative Sequence:

- If Elira selects "Explore re-financing options," the system generates a draft message with recommended mortgage advisor contacts.
- If Elira selects "Pause and re-engage in 60 days," the system sets a 60-day reminder and moves the client to Long-term Nurturing status.
- If no lower-budget properties match the client's preferences, the system notifies Elira and offers to broaden search criteria or suggest the pause option.

Special Requirements:

- At-risk flagging with predefined reason list and free-text option.
- Automatic property status reversion when deal is marked Closed - Lost.
- Automatic commission removal from financial summaries.
- Recovery action suggestion engine based on collapse reason.

- Cross-client matching so re-available properties are immediately presented to other interested clients.

Post-condition: The collapsed deal is closed as lost, the property is available again for other clients, no commission is incorrectly tracked, the client is re-engaged with alternative options, a follow-up reminder is set, and the property appears in match results for other active clients.
