

REAL ESTATE MANAGEMENT SYSTEM

Use Case Descriptions

Use case name:	UC-1	
Scenario:	Scenario 1: Onboarding a New Lead from social media	
Triggering event:	Agent receives a direct message from a potential client on Instagram and decides to register them in REMS.	
Brief description:	The agent creates a new client profile in REMS capturing all relevant details, assigns a status, and sets a follow-up reminder so the lead is not lost.	
Actors:	Real Estate Agent (Elira) - Primary Actor REMS System - Secondary Actor	
Related use cases:	Log Client Interaction (UC-4) Client-Property Matching (UC-5) Send Automated Reminder (UC-8)	
Stakeholders:	Real Estate Agent - needs organized lead records and timely follow-up reminders Buyer/Tenant Client (Drita) - benefits from prompt, professional responses	
Preconditions:	Agent is authenticated and logged into REMS Agent has received initial contact from the lead via social media	
Postconditions:	A new client profile is saved in the system Client is tagged with a status and visible on the dashboard A follow-up reminder is scheduled	
Flow of activities:	Actor 1. Agent opens the 'Add Client' screen in REMS 2. Agent enters client details: name,number, budget, property type (apartment, 2 bedrooms), preferred area, and timeframe. 3. Agent selects the lead source and tags the client as 'Active'. 4. Agent sets a follow-up reminder for 5 days. 5. Agent saves the profile.	System 1. System displays the client profile form. 2. System validates all required fields in real time. 3. System records the status and source. 4. System schedules the reminder notification. 5. System creates the client record, displays it on the dashboard with a follow-up countdown.
Exception conditions:	Missing required fields (name or contact number): System highlights empty fields and prevents saving. Duplicate contact number detected: System warns the agent that a client with the same number already exists and offers to view the existing record. Network unavailable: System saves the record locally and syncs to cloud on reconnect.	

Figure 1a: Fully developed use case description for "Onboard a New Lead from Social Media"

Use case name:	UC-2	
Scenario:	Scenario 2: Property Status Update in the Field	
Triggering event:	Client rejects a property during an in-person viewing; agent needs to record feedback and find alternative options on-site.	
Brief description:	The agent logs viewing feedback against the property, marks it as 'shown' to the client, then uses REMS to filter available properties matching the client's criteria.	
Actors:	Real Estate Agent (Elira) - Primary Actor REMS System -Secondary Actor	
Related use cases:	Schedule Viewing (UC-6) Client-Property Matching (UC-5) Log Client Interaction (UC-4)	
Stakeholders:	Real Estate Agent - needs instant in-field access to property data and matching tools Buyer/Tenant Client (Drita) - expects relevant property alternatives without delay	
Preconditions:	Agent is authenticated and on-site at a property A viewing record exists linking the client and the property Client profile with preferences is stored in REMS	
Postconditions:	Viewing feedback is recorded against the property listing Property is marked as 'shown' to the client Agent has a filtered list of alternative properties to discuss	
Flow of activities:	Actor	System
	1. Agent opens the property listing in REMS 2. Agent taps 'Add Viewing Note' and enters feedback: 'Shown to Drita, not interested, ceiling too low'. 3. Agent marks the property as 'Shown' to the linked client. 4. Agent opens the client profile and taps 'Find Matching Properties'. 5. Agent reviews the list and identifies two suitable options to discuss.	1. System displays the property detail page. 2. System saves the note with a timestamp. 3. System records the shown relationship; property status remains 'Available'. 4. System runs a match query against the client's budget, area, and property type and returns a ranked list of available alternatives. 5. System highlights any properties not previously shown to the client.
Exception conditions:	No matching properties found: System informs the agent and suggests relaxing filter criteria (e.g., wider area or higher budget). Property listing not found: System displays a not-found message; agent may need to create or import the listing. Network unavailable: System reads cached property data and syncs feedback on reconnect

Use case name:	UC-3	
Scenario:	Scenario 3 : Scheduling and Managing a Viewing	
Triggering event:	Client confirms availability for a property viewing on a specific date and time.	
Brief description:	The agent schedules a viewing in REMS linking the client, property, date, and time. The system syncs to Google Calendar and sends automated reminders. Post-viewing, the agent logs feedback and creates a deal record.	
Actors:	Real Estate Agent (Elira) -Primary Actor REMS System - Secondary Actor Google Calendar - External System	
Related use cases:	Onboard Client (UC-1) Manage Deal Pipeline (UC-7) Send Automated Reminder (UC-8)	
Stakeholders:	Real Estate Agent – needs reliable scheduling and timely reminders Buyer/Tenant Client (Drita) – expects punctual, prepared agent	
Preconditions:	Agent is authenticated in REMS Client profile and property listing exist in the system Google Calendar integration is enabled	
Postconditions:	Viewing appointment is saved and visible in the daily/weekly agenda Appointment is synced to Google Calendar Post-viewing feedback and deal record are created	
Flow of activities:	Actor	System
	1. Agent opens the 'Appointments' section and taps 'New Viewing'. 2. Agent selects the client, property, and sets date/time. 3. Agent saves the appointment. 4. Agent receives a push notification. 5. After the viewing, agent opens the appointment record and taps 'Log Feedback'. 6. Agent selects 'Very interested' and adds notes. 7. Agent taps 'Create Deal' from the viewing screen.	1. System displays the new viewing form. 2. System validates the time slot and checks for conflicts. 3. System creates the viewing record, displays it in the agenda, and syncs it to Google Calendar. 4. System sends a 2-hour-before reminder via push notification. 5. System displays the feedback form. 6. System saves the feedback. 7. System pre-fills a new deal record with the client and property data.
Exception conditions:	Calendar sync failure: System saves locally and retries; notifies agent of the failure. Time slot conflict: System warns the agent and suggests the next available slot. Viewing cancelled: Agent logs a cancellation reason; system archives the record with a cancellation note.	

Figure 3c: Fully developed use case description for "Schedule, Receive Reminder, and Log Viewing Feedback"

Use case name:	UC-4	
Scenario:	Scenario 4 :Managing a Deal Through Negotiation	
Triggering event:	Client verbally agrees to make an offer on a property.	
Brief description:	The agent creates a deal record in REMS and advances it through defined pipeline stages, logging notes, attaching documents, and recording party details at each stage until the deal is closed and commission is calculated	
Actors:	Real Estate Agent (Elira) - Primary Actor REMS System - Secondary Actor	
Related use cases:	Schedule Viewing (UC-6) Track Commissions (UC-9) Send Automated Reminder (UC-8)	
Stakeholders:	Real Estate Agent - needs a clear view of deal progress and document trail Property Owner (Arben) - expects to be informed at key milestones Legal Representative - involved at contract and final sale stages	
Preconditions:	A viewing has taken place and the client has expressed intent to make an offer Client and property records exist in REMS	
Postconditions:	Deal is marked 'Closed' with all stages, notes, and documents recorded Commission is automatically calculated based on the agreed rate Property status is updated to 'Sold'	
Flow of activities:	Actor	System
	1. Agent taps 'Create Deal' and links the client, property, and owner. 2. Agent logs the offered price. 3. Agent updates the stage to 'Negotiation in Progress' and notes the owner's counter-offer. 4. Agent advances stage to 'Verbal Agreement' 5. Agent advances to 'Security Deposit Paid' and attaches the deposit contract. 6. Agent adds the legal representative as a deal party. 7. Agent marks the final stage 'Final Sale Signed'. 8. Agent confirms the commission rate (2%)	1. System creates the deal record at stage 'Offer Initiated'. 2. System saves the offer amount. 3. System records the stage change with timestamp and note. 4. System logs the stage transition. 5. System stores the document against the deal. 6. System records the party with their contact details. 7. System logs the stage and transitions deal to 'Closed'. 8. System calculates and displays the expected commission based on the agreed sale price
Exception conditions:	Deal stalls (no update in 7 days): System sends an automated stale-deal notification to the agent. Agent flags deal as 'At Risk': System records the risk reason and prompts the agent to set a corrective action. Deal collapses: Agent marks 'Closed - Lost'; system releases the property back to 'Available' status.	

Figure 4d: Fully developed use case description for "Manage a Deal Through Negotiation to Closure"

Use case name:	UC-5	
Scenario:	Scenario 5 : Following Up with a Long-term Client	
Triggering event:	A 90-day check-in reminder fires for a client who was not ready to buy at their last interaction.	
Brief description:	The agent receives a push notification, reviews the client's history, initiates a WhatsApp message with a relevant new listing, logs the interaction, and sets the next reminder.	
Actors:	Real Estate Agent (Elira) - Primary Actor REMS System - Secondary Actor WhatsApp - External Communication Channel	
Related use cases:	Onboard Client (UC-1) Client-Property Matching (UC-5) Send Automated Reminder (UC-8)	
Stakeholders:	Real Estate Agent - needs to stay visible to long-term clients without manual tracking Buyer/Tenant Client (Drita) - expects relevant, timely communication	
Preconditions:	Client is tagged as 'Long-term / Nurturing' in REMS A 90-day check-in reminder was previously set Client preferences are saved in the system	
Postconditions:	Outreach is logged as an interaction against the client record Next check-in reminder is set (45 days) Suggested property is linked to the client profile	
Flow of activities:	Actor	System
	1. Agent receives a push notification: '90-day check-in due for [Client Name]'. 2. Agent taps the notification. 3. Agent reviews the client's history, saved preferences, and previous notes. 4. Agent taps 'Open WhatsApp' and sends a message with a new matching listing. 5. Agent returns to REMS and logs the outreach as an interaction. 6. Agent sets the next check-in reminder for 45 days.	1. System fires the scheduled reminder notification. 2. 1. System fires the scheduled reminder notification. 3. System displays the full interaction timeline and preferences. 4. System opens WhatsApp pre-filled with the client's number. 5. System records the interaction (date, channel: WhatsApp, short note). 6. System schedules the next reminder and updates the client's last-contact date.
Exception conditions:	WhatsApp not installed or number invalid: System displays an error; agent can call or send SMS instead. No matching new listings exist: System flags the absence; agent can update preferences or note the contact manually. Client replies they are no longer interested: Agent updates status to 'Inactive' and cancels future reminders.	

Figure 5e: Fully developed use case description for "Follow Up with a Long-term Nurturing Client"

Use case name:	UC-6	
Scenario:	Scenario 6 : Reviewing Monthly Finances	
Triggering event:	End of month; agent wants to review earnings, pending commissions, and expenses.	
Brief description:	The agent opens the Financial Summary section of REMS, reviews closed deals and commission status, flags a pending payment, logs expenses, and compares net earnings against her monthly target.	
Actors:	Real Estate Agent (Elira) - Primary Actor REMS System - Secondary Actor	
Related use cases:	Manage Deal Pipeline (UC-7) Track Commissions (UC-9) View Performance Dashboard (UC-10)	
Stakeholders:	Real Estate Agent – needs clear visibility into income and expenses to manage her business	
Preconditions:	At least one deal has been closed in the current month Commission rates and expense entries exist for each deal	
Postconditions:	Commission payment statuses are updated (Pending, Paid) Expenses are recorded per deal Net earnings and progress toward monthly target are displayed	
Flow of activities:	Actor	System
	1. Agent opens the 'Financial Summary' section. 2. Agent reviews closed deals 3. Agent identifies one unpaid commission and flags it as 'Pending'. 4. Agent logs expenses across the deals (photography, fuel, broker fee). 5. Agent views the net earnings summary	1. System loads the monthly overview: total expected commissions, received, expenses, and net earnings. 2. System displays each deal with commission breakdown. 3. System updates the payment status and marks the deal for follow-up. 4. System saves expenses per deal and recalculates net earnings 5. System displays the summary and compares it to the monthly target
Exception conditions:	Commission rate not set for a deal: System highlights the deal and prompts the agent to enter the applicable rate before calculating. Expense entry fails validation (negative value, missing category): System highlights the error and prevents saving. No deals closed this month: System displays zero values and encourages the agent to review active deals.	

Figure 6f: Fully developed use case description for "Review Monthly Financial Performance"

Use case name:	UC-7	
Scenario:	Scenario 7 : Handling a Collapsed Deal	
Triggering event:	Client's bank loan application is rejected, causing the deal to fall through at the 'Legal Review' stage.	
Brief description:	The agent flags the deal as 'At Risk', records the reason, closes it as 'Closed – Lost', logs a follow-up task for the client, and the system automatically releases the property back to 'Available' status.	
Actors:	Real Estate Agent (Elira) - Primary Actor REMS System - Secondary Actor	
Related use cases:	Manage Deal Pipeline (UC-7) Onboard Client (UC-1) Update Property Status (UC-3)	
Stakeholders:	Real Estate Agent - needs to cleanly close failed deals and re-activate the property Property Owner (Arben) - needs property relisted promptly Buyer/Tenant Client (Drita) - may need alternative financing guidance	
Preconditions:	A deal exists in 'Legal Review' stage Agent has been informed of the loan rejection	
Postconditions:	Deal is marked 'Closed - Lost' with reason recorded Property status is automatically reset to 'Available' A follow-up task for the client is logged	
Flow of activities:	Actor 1. Agent opens the deal in REMS. 2. Agent taps 'Flag as At Risk' and enters reason: 'Loan rejected by bank'. 3. Agent changes deal status to 'Closed - Lost' 4. Agent logs a follow-up task: 'Contact client about alternative financing or lower-budget property'. 5. Agent verifies the property is visible in the active listings pool.	System 1. System displays the deal detail page at 'Legal Review' stage. 2. System records the at-risk flag and reason with a timestamp. 3. System closes the deal (preserving all historical data) and automatically updates the property status to 'Available'. 4. System closes the deal (preserving all historical data) and automatically updates the property status to 'Available'. 5. System confirms the property appears in available listings and is eligible for client-property matching.
Exception conditions:	Agent attempts to close a deal without entering an at-risk reason: System requires a reason before allowing status change to 'Closed - Lost'. Property has already been sold (data conflict): System detects the conflict and alerts the agent to review the property record manually. Follow-up task creation fails: System saves the deal closure and notifies the agent that the task needs to be re-entered.
